Keywords: metadiscourse, reformulation markers, Lithuanian, English

Schedule: Thu 16.30 Room 10

Research writing in different science fields and cultures has been one of the favored objects of discourse studies of the past several decades. One area of research writing that has attracted considerable attention of scholars is the use of metadiscourse markers, which are employed by academic writers to create convincing, powerful and coherent discourse. A growing body of literature on hedges, boosters, attitudinal lexis, personal pronouns and other metadiscourse items has revealed interesting ways in which the ‘big culture’ (i.e. national culture) and the ‘small culture’ (i.e. disciplinary culture) (cf. Atkinson 2004) play a role in the creation of academic text (see Fløttum et al. 2006, Hyland 2005, Hyland & Sancho Guinda 2012, Mur-Dueñas 2011, inter alia). One metadiscourse category, reformulation markers or code glosses (Hyland 2005), are very important contributors to “coherent, reader-friendly prose” (Hyland 2007: 266), employed to facilitate the reader’s understanding of the message the writer tries to convey. While there is a number of studies investigating reformulation markers in English (see, for example, Del Saz Rubio 2007 for an overview) these metadiscourse items received less attention in languages other than English or in a contrastive perspective, a notable exception being Spanish vs English studies (Cuenca 2003, Murillo 2012, 2016).

The aim of the present paper is to address this gap by contrasting forms and functions of reformulation markers employed in research writing in two languages (American English and Lithuanian) and three science fields (humanities, medicine, technology). Quantitative and qualitative approaches are employed alongside contrastive analysis to reveal the ways in which the two languages and three science fields overlap or differ with regard to the use of reformulation markers. The English language data is taken from the Academic language subcorpus of COCA, while the Lithuanian language data comes from Corpus Academicum Lithuanicum (www.coralit.lt), a specialized synchronic corpus of written academic Lithuanian (roughly 9 million words). The first part of the paper looks at the distribution and frequency patterns of reformulation markers taking into account disciplinary and language specific variation in their use. The second part follows the classificational framework suggested by Murillo (2012) in order to reveal the primary functions these markers perform in different disciplines and research cultures. The preliminary results suggest that it is the humanities scholars who employ reformulation markers most frequently in both languages. The cross-cultural analysis reveals interesting rhetorical and pragmatic functional employment of these markers in the two languages. Extending research on the use of metadiscourse elements in languages other than
English helps to highlight universal patterns of research writing as well as peculiar features typical to specific cultural communities.
